This script is not a substitute for Prof. Schindler's lecture notes and will not be reviewed by her again. Basically, these are just my personal notes, so I do not guarantee correctness or completeness and I might add further examples and notes if necessary. In general I will not include proofs (because this is no fun in LATEX).

If you have any corrections, you can write to me at Stud.IP or make a pull request directly at the GitHub repository (which is much more convenient for me than the way via Stud.IP).

glhf, Alex

1 Number Fields

Example (Pell equation): Let d > 1 be an integer, which is not a square, and find all integer solutions to

Lecture 1, 24.10.2023

$$x^2 - dy^2 = 1. (1.1)$$

Write $\mathbb{Z}[\sqrt{d}] = \{a + \sqrt{d}b \mid a, b \in \mathbb{Z}\} \subseteq \mathbb{Q}[\sqrt{d}]$ with its natural ring structure. If $(x, y) \in \mathbb{Z}^2$ is a solution to (1.1), then

$$(x + \sqrt{dy})(x - \sqrt{dy}) = x^2 - dy^2 = 1$$

and for every $k \in \mathbb{N}$

$$(x + \sqrt{dy})^k (x - \sqrt{dy})^k = x_k^2 - dy_k^2 = 1,$$

with $x_k, y_k \in \mathbb{Z}$. I.e. if $(x, y) \neq (\pm 1, 0)$ we can generate new solutions as above. Define the norm map $N : \mathbb{Z}[\sqrt{d}] \to \mathbb{Z}$, $a + \sqrt{d}b \mapsto a^2 - db^2$. Then solutions to (1.1) can be described as units $x + \sqrt{d}y \in \mathbb{Z}[\sqrt{d}]^*$ in the ring $\mathbb{Z}[\sqrt{d}]$ with $N(x + \sqrt{d}y) = 1$.

Example (Gaussian integers): The question is to find all primes p which can be written as a sum of two integer squares

$$p = a^2 + b^2.$$

I.e. we ask for primes p which factor as p = (a + ib)(a - ib) in the ring $\mathbb{Z}[i]$.

1.1 Number fields and number rings, first definitions and examples

Definition (Number field)

A number field is a finite field extension of \mathbb{Q} .

Example: a) For $d \in \mathbb{Z}$, where d is not a square, the fields $\mathbb{Q}[\sqrt{d}] = \mathbb{Q}[x]/(x^2 - d)$ are number fields (with degree 2 over \mathbb{Q}). We call $\mathbb{Q}[\sqrt{d}]$ a real quadratic field

if d > 0 and an imaginary quadratic field if d < 0.

- b) $\mathbb{Q}[\sqrt{d_1}, \sqrt{d_2}]$ are number fields for $d_1, d_2 \in \mathbb{Z}$, usually called biquadratic fields.
- c) Let $m \in \mathbb{N}$ and $\omega = e^{\frac{2\pi i}{m}}$. Then $\mathbb{Q}[\omega]$ is a number field, called the *m-th* cyclotomic field.
- ?) What could be an analogue of the integers in a general number field?

$$Z \subset \mathbb{Q}$$
 ? $\subset \mathbb{Q}[\sqrt{d}]$? $\subset \mathbb{F}$

Definition (Algebraic integer)

A complex number $\alpha \in \mathbb{C}$ is called an *algebraic integer*, if there is a monic polynomial $P(x) \in \mathbb{Z}[x]$ with $P(\alpha) = 0$.

Example: • Every $n \in \mathbb{Z}$ is an algebraic integer.

- \sqrt{d} for $d \in \mathbb{Z}$ is an algebraic integer (take $P(x) = x^2 d$).
- $e^{\frac{2\pi i}{m}}$ is an algebraic integer for every $m \in \mathbb{N}$ (take $P(x) = x^m 1$).

Theorem 1.1

Let α be an algebraic integer and $f(x) \in \mathbb{Z}[x]$ a monic polynomial with f(x) = 0. If f(x) is of minimal degree with these properties, then f is irreducible.

Remark: Theorem 1.1 shows, that the minimal polynomial of an algebraic integer over \mathbb{Q} has coefficients in \mathbb{Z} .

Lemma 1.2

Let $f \in \mathbb{Z}[x]$ be a monic polynomial and $g, k \in \mathbb{Q}[x]$ monic polynomials with f = gh. Then, $g, k \in \mathbb{Z}[x]$.

Corollary 1.3

If $\alpha \in \mathbb{Q}$ is an algebraic integer, then $\alpha \in \mathbb{Z}$.

Theorem 1.4 (Characterization of algebraic integers)

Let $\alpha \in \mathbb{C}$. Then the following statements are equivalent:

(i) α is an algebraic integer.

- (ii) $\mathbb{Z}[\alpha]$ is a finitely generated group (under addition).
- (iii) There exists a subring $R \subset \mathbb{C}$ with $\alpha \in R$ and such that (R, +) is a finitely generated group.
- (iv) There is a non-trivial finitely generated subgroup (A, +) of \mathbb{C} , such that $\alpha A \subseteq A$.

Corollary 1.5

The set of algebraic integers in \mathbb{C} is a ring.

Lecture 2, 27.10.2023

Definition (Ring of algebraic integers)

Let K be a number field. Then we write \mathcal{O}_K for the set of algebraic integers contained in K and we call \mathcal{O}_K the ring of integers of K.

Example: $\mathcal{O}_{\mathbb{Q}} = \mathbb{Z}$

Proposition 1.6

Let $d \in \mathbb{Z}$ be a squarefree integer.

- If $d \equiv 2, 3 \mod 4$ then $\mathcal{O}_{\mathbb{Q}[\sqrt{d}]} = \{a + \sqrt{db} \mid a, b \in \mathbb{Z}\}.$
- If $d \equiv 1 \mod 4$, then $\mathcal{O}_{\mathbb{Q}[\sqrt{d}]} = \left\{ \frac{a + \sqrt{d}b}{2} \mid a \equiv b \mod 2 \right\}$.

1.2 Embeddings, Norm and Trace

Recall: Let L/K be a finite field extension. If charK = 0, then L/K is separable. Let \bar{K} be an algebraic closure of K. If L/K is separable, them $[L:K] = \# \operatorname{Hom}_K(L,\bar{K})$.

Theorem

Let L/K be a finite separable field extension. Then there exists an element $\alpha \in L$ such that $L = K(\alpha)$. In particular, for number fields $Q \subseteq K \subseteq L$ we obtain the following:

- There exists $\alpha \in L$ such that $L = K(\alpha)$
- If there is an embedding $\hat{\iota}: K \hookrightarrow \mathbb{C}$, then there exist [L:K] embeddings $L \hookrightarrow \mathbb{C}$, which extend $\hat{\iota}$. If g(x) is a minimal polynomial of α over K then the embeddings are given by $\sigma_i: \alpha \mapsto \beta_i$, where $\beta_1, \ldots, \beta_{[L:K]}$ are the [L:K] distinct conjugates of α .

Example: 1. Let $d \in \mathbb{Z}$ be not a square. Then there are exactly two embeddings of $\mathbb{Q}[\sqrt{d}]$ into \mathbb{C} , namely $\sigma_1 : a + \sqrt{d}b \mapsto a + \sqrt{d}b$ and $\sigma_2 : a + \sqrt{d}b \mapsto a - \sqrt{d}b$.

2. We have $[\mathbb{Q}[\sqrt[3]{2}:\mathbb{Q}]]=3$ and the three embeddings are given by

$$\sigma_1(\sqrt[3]{2}) = \sqrt[3]{2}, \ \sigma_2(\sqrt[3]{2}) = e^{\frac{2\pi i}{3}}\sqrt[3]{2}, \ \sigma_3(\sqrt[3]{2}) = e^{\frac{4\pi i}{3}}\sqrt[3]{2}.$$

Note that $\sigma_1(\mathbb{Q}[\sqrt[3]{2}]) \subseteq \mathbb{R}$, whereas σ_2 and σ_3 are "complex embeddings". $\mathbb{Q}[\sqrt[3]{2}]/\mathbb{Q}$ is not a normal extension.

Definition (Trace and norm)

Let K be a field and V an n-dimensional K-vector space. For $\varphi:V\to V$ a K-endomorphism, we define the characteristic polynomial

$$\chi_{\varphi}(x) = \det(xI_n - \varphi) = \sum_{i=0}^{n} c_i x^{n-i}$$

for some $c_0, \ldots, c_n \in K$. We define the determinant and trace of φ by $\det \varphi = (-1)^n c_n$ and trace $\varphi = -c_1$

Note that if $\varphi, \psi : V \to V$ are both K-endomorphisms of V, then $\det(\varphi \circ \psi) = \det(\varphi) \det(\psi)$ and $\operatorname{trace}(a\varphi + b\psi) = a \operatorname{trace}(\varphi) + b \operatorname{trace}(\psi) \ \forall a, b \in K$.

Definition

Let $\mathbb{Q} \subseteq K \subseteq L$ be number fields and $\alpha \in L$. We write $\varphi_{\alpha} : L \to L$, $x \mapsto \alpha x$ and define the (relative) norm and trace of α by

$$N_{L/K}(\alpha) = \det \varphi_{\alpha}, \quad \operatorname{Tr}_{L/K}(\alpha) = \operatorname{trace}(\varphi_{\alpha}).$$

Remark: The map $N_{L/K}: L^* \to K^*$ is a grouphomomorphism as $N_{L/K}(\alpha\beta) = N_{L/K}(\alpha)N_{L/K}(\beta) \ \forall \alpha, \beta \in L \setminus \{0\}$. Similarly, $\text{Tr}_{L/K}: L \to K$ is a K-linear map, as

$$\operatorname{Tr}_{L/K}(u\alpha + v\beta) = u \operatorname{Tr}_{L/K}(\alpha) + v \operatorname{Tr}_{L/K}(\beta) \ \forall u, v \in K, \ \alpha, \beta \in L.$$

Example: Let $K = \mathbb{Q}$, $L = \mathbb{Q}(i)$ and $\alpha = a + ib \in \mathbb{Q}(i)$. Then φ_{α} can be represented with respect to the basis 1, i by

$$\varphi_{\alpha} = \begin{bmatrix} a & -b \\ b & a \end{bmatrix}$$

and hence

$$N_{L/\mathbb{Q}}(a+ib) = a^2 + b^2$$
, $\operatorname{Tr}_{L/\mathbb{Q}}(a+ib) = 2a$.

Lemma 1.7

Let L/K is an extension of number fields with [L:K] = n. For $a \in K$ we have

$$N_{L/K}(a) = a^n$$
, $\operatorname{Tr}_{L/K} = na$.

Lemma 1.8

Let L/K be an extension of number fields with $L = K(\alpha)$ and [L : K] = n. Let $f(x) = x^n + c_1 x^{n-1} + \cdots + c_n$ be the minimal polynomial of α over K. Then

$$N_{L/K}(\alpha) = (-1)^n c_n$$
, $\operatorname{Tr}_{L/K}(\alpha) = -c_1$.

Lemma 1.9

Let L/K be a number field extension, $\alpha \in L$, $[L:K(\alpha)] = r$. Then we have

$$N_{L/K}(\alpha) = (N_{K(\alpha/K)}(\alpha))^r$$
, $\operatorname{Tr}_{L/K}(\alpha) = r \operatorname{Tr}_{K(\alpha)/K}(\alpha)$.

Corollary 1.10

Let L/K be number fields and $\alpha \in \mathcal{O}_L$. Then $N_{L/K}(\alpha)$, $\operatorname{Tr}_{L/K}(\alpha) \in \mathcal{O}_K$. In particular $N_{L/\mathbb{Q}}(\alpha)$, $\operatorname{Tr}_{L/\mathbb{Q}} \in \mathbb{Z}$.

Theorem 1.11

Let L/K be number fields, [L:K] = n and $\sigma_1, \ldots, \sigma_n : L \hookrightarrow \mathbb{C}$ be the n distinct K-linear embeddings of L into \mathbb{C} . Then, for $\alpha \in L$, we have

$$N_{L/K}(\alpha) = \prod_{i=1}^{n} \sigma_i(\alpha), \quad \operatorname{Tr}_{L/K}(\alpha) = \sum_{i=1}^{n} \sigma_i(\alpha).$$

Corollary 1.12

Let L/K be a Galois extension of number fields. Then, for $\alpha \in L$ and $\sigma \in \operatorname{Gal}(L/K)$, we have

$$N_{L/K}(\sigma(\alpha)) = N_{L/K}(\alpha), \quad \operatorname{Tr}_{L/K}(\sigma(\alpha)) = \operatorname{Tr}_{L/K}(\alpha).$$

Theorem 1.13

Let $K \subseteq L \subseteq M$ be a tower of number fields and $\alpha \in M$. Then

$$N_{M/K} = N_{L/K}(N_{M/L}(\alpha)), \quad \operatorname{Tr}_{M/K}(\alpha) = \operatorname{Tr}_{L/K}(\operatorname{Tr}_{M/L}(\alpha)).$$

Lecture 3, 03.11.2023

An application of the norm map

Given a number field K with ring of integers \mathcal{O}_K , how can we find \mathcal{O}_K^* , i.e. the units in \mathcal{O}_K ?

- If $\alpha \in \mathcal{O}_K^*$, $\alpha^{-1} \in \mathcal{O}_K$ and $1 = N_{K/\mathbb{Q}}(\alpha \alpha^{-1}) = N_{K/\mathbb{Q}}(\alpha) \cdot N_{K/\mathbb{Q}}(\alpha^{-1})$. By Corollary 1.10, $N_{K/\mathbb{Q}}(\alpha)$, $N_{K/\mathbb{Q}}(\alpha^{-1}) \in \mathbb{Z} \implies N_{K/\mathbb{Q}}(\alpha) = \pm 1$.
- If $\alpha \in \mathcal{O}_K$ with $N_{K/\mathbb{Q}}(\alpha) = \pm 1$, then $\alpha \in \mathcal{O}_K^*$.

Example: Let $d \in \mathbb{Z}$, d squarefree. Then, for $a, b \in \mathbb{Q}$, $N_{\mathbb{Q}[\sqrt{d}]/\mathbb{Q}}(a + \sqrt{d}b) = (a + b\sqrt{d})(a - b\sqrt{d}) = a^2 - db^2$. For $d \equiv 2, 3 \mod 4$, we find that

$$\mathcal{O}_{\mathbb{Q}[\sqrt{d}]} = \left\{ a + b\sqrt{d} \mid a, b \in \mathbb{Z}, \ a^2 - db^2 = \pm 1 \right\}.$$

The trace as a bilinear form

Let L/K be number fields. Then $\mathrm{Tr}_{L/K}$ induces a bilinear form

$$\operatorname{Tr}_{L/K}: L \times L \to K, \ (x, y) \mapsto \operatorname{Tr}_{L/K}(x \cdot y).$$
 (1.2)

Write L^* for the dual vector space of L, i.e. the set of all K-linear vector space homomorphisms.

Theorem 1.14

The bilinear form (1.2) induces an isomorphism of K-vector spaces

$$\psi: L \to L^*, \ x \to \operatorname{Tr}_{L/K}(x,\cdot).$$

Corollary 1.15

Let L/K be number fields and (v_1, \ldots, v_n) a K-basis with n = [L : K]. Then there exists a unique K-basis (w_1, \ldots, w_n) of L, such that $\operatorname{Tr}_{L/K}(v_i w_j) = \delta_{ij}$, $1 \le i, j, \le n$.

1.3. Discriminant Lecture 3

1.3 Discriminant

Let K/\mathbb{Q} be a number field of degree $n = [K : \mathbb{Q}]$ and $\sigma_1, \ldots, \sigma_n : K \to \mathbb{C}$ its embeddings.

Definition (Discriminant)

For $\alpha_1, \ldots, \alpha_n \in K$, we define the discriminant as

$$\operatorname{disc}(\alpha_1,\ldots,\alpha_n) = \operatorname{det}\left((\sigma_i(\alpha_j))_{1 \leq i,j \leq n}\right)^2.$$

Theorem 1.16

Let $\alpha_1, \ldots, \alpha_n \in K$. Then $\alpha_1, \ldots, \alpha_n$ are \mathbb{Q} -linearly independent if and only if $\operatorname{disc}(\alpha_1, \ldots, \alpha_n) \neq 0$.

Lemma 1.17

Let $\alpha_1, \ldots, \alpha_n \in K$. Then

$$\operatorname{disc}(\alpha_1,\ldots,\alpha_n) = \operatorname{det}\left(\operatorname{Tr}_{K/\mathbb{Q}}(\alpha_i\alpha_j)\right)_{1 \le i,j \le n}.$$

Corollary 1.18

Let $\alpha_1, \ldots, \alpha_n \in K$. Then $\operatorname{disc}(\alpha_1, \ldots, \alpha_n) \in \mathbb{Q}$. If moreover $\alpha_1, \ldots, \alpha_n \in \mathcal{O}_K$, then $\operatorname{disc}(\alpha_1, \ldots, \alpha_n) \in \mathbb{Z}$.

Theorem 1.19

Let α be algebraic over \mathbb{Q} with $\left[\mathbb{Q}[\alpha]:\mathbb{Q}\right]=n$, and α_1,\ldots,α_n the n different conjugates of α . Then

$$\operatorname{disc}\left(1,\alpha,\ldots,\alpha^{n-1}\right) = \prod_{1 \leq i,j \leq n} (a_i - a_j)^2.$$

If moreover f(x) is the minimal polynomial of α over \mathbb{Q} , then

$$\operatorname{disc}\left(1,\alpha,\ldots,\alpha^{n-1}\right) = (-1)^{\frac{n(n-1)}{2}} N_{\mathbb{Q}[\alpha]/\mathbb{Q}}\left((f'(\alpha))\right).$$

Question: Let K be a number field with ring of integers \mathcal{O}_K and of degree $n = [K : \mathbb{Q}]$. Then K is an n-dimensional \mathbb{Q} -vector space. Hpw can we describe the structure of the group $(\mathcal{O}_K, +)$?

Example: For $d \in \mathbb{Z}$ squarefree and $K = \mathbb{Q}[\sqrt{d}]$, the ring of integers \mathcal{O}_K is a free abelian group of rank 2, where a \mathbb{Z} -basis is given by $(1, \omega)$, with

$$\omega = \begin{cases} \sqrt{d} & d \equiv 2, 3 \mod 4, \\ \frac{1+\sqrt{d}}{2} & d \equiv 1 \mod 4. \end{cases}$$

Theorem 1.20

Let K/\mathbb{Q} be a number field of degree $n = [K : \mathbb{Q}]$. Then \mathcal{O}_K is a free abelian group of rank n, i.e. there exists $\alpha_1, \ldots, \alpha_n \in \mathcal{O}_K$, such that every $\beta \in \mathcal{O}_K$ can be uniquely written in the form

$$\beta = m_1 \alpha_1 + \dots + m_n \alpha_n$$

with $m_1, \ldots, m_n \in \mathbb{Z}$.

Remark: In the notation of Theorem 1.20, we call $(\alpha_1, \ldots, \alpha_n)$ and integral basis of \mathcal{O}_K (over \mathbb{Z}).

Lecture 4, 07.11.2023

Lemma 1.21

Let K be a number field as above. Then there exists a \mathbb{Q} -basis of the number field, say $(\alpha_1, \ldots, \alpha_n)$, with $\alpha_1, \ldots, \alpha_n \in \mathcal{O}_K$.

Proposition 1.22

Let $(\alpha_1, \ldots, \alpha_n)$ be a \mathbb{Q} -basis of a number field K with $\alpha_1, \ldots, \alpha_n \in \mathcal{O}_K$, $d = \operatorname{disc}(\alpha_1, \ldots, \alpha_n)$ and $\beta \in \mathcal{O}_K$. Then there exist $m_1, \ldots, m_n \in \mathbb{Z}$, such that

$$\beta = \frac{m_1 \alpha_1 + \dots + m_n \alpha_n}{d}$$

and $d \mid m_i^2$ for $1 \leq i \leq n$.

Lemma 1.23

Let K be a number field with integral bases $(\alpha_1, \ldots, \alpha_n)$ and $(\beta_1, \ldots, \beta_n)$. Then

$$\operatorname{disc}(\alpha_1,\ldots,\alpha_n)=\operatorname{disc}(\beta_1,\ldots,\beta_n).$$

Definition (Discriminant of K)

Let K be a number field and $(\alpha_1, \ldots, \alpha_n)$ a \mathbb{Z} -basis for \mathcal{O}_K . We define the discriminant

disc(K) of K as

$$\operatorname{disc}(K) = \operatorname{disc}(\alpha_1, \dots, \alpha_n).$$

Example: Let $d \in \mathbb{Z}$ be squarefree. Then

$$\operatorname{disc}\left(\left[\sqrt{d}\right]\right) = \begin{cases} 4d & d \equiv 2, 3 \mod 4, \\ d & d \equiv 1 \mod 4. \end{cases}$$

1.4 Cyclotomic fields

Definition

For $m \in \mathbb{N}$ we call $\mathbb{Q}\left[e^{\frac{2\pi i}{m}}\right]$ the m-th cyclotomic field.

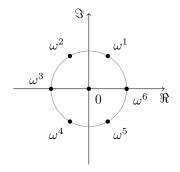

Example: • The first two cyclotomic fields are equal to \mathbb{Q} .

• Let m=6 and write $\omega=e^{\frac{2\pi i}{6}}$. Then $\omega^5=-\omega^2$, i.e. $\omega=-\omega^4$ and $\mathbb{Q}[\omega]=\mathbb{Q}[\omega^2]$. This means that the third and sixth cyclotomic fields are equal.

In the following let $m \in \mathbb{N}$ and write $\omega = e^{\frac{2\pi i}{m}}$.

Theorem 1.24

The extension $\mathbb{Q}[\omega]$ over \mathbb{Q} is Galois with degree equal to $\varphi(m)$, where φ is Euler's totient function. Moreover, the Galois group is isomorphic to $(\mathbb{Z}/m\mathbb{Z})^* = \{k \in \mathbb{Z}/m\mathbb{Z} \mid \gcd(k,m) = 1\}.$

For $k \in (\mathbb{Z}/m\mathbb{Z})^*$ the corresponding automorphism is given by $\omega \mapsto \omega^k$.

Proposition 1.25

The conjugates of ω are exactly given by ω^k with gcd(m, k) = 1.

Corollary 1.26

Let $m \in \mathbb{N}$ be even. Then the roots of unity contained in $\mathbb{Q}(e^{\frac{2\pi i}{m}})$ are exactly the m-th roots of unity.

Corollary 1.27

The m-th cyclotomic fields, for m even, are all non-isomorphic.

Theorem 1.28

Let $m = p^r$ for some prime p and $\omega = e^{\frac{2\pi i}{m}}$. Then $\mathcal{O}_{Q[\omega]} = \mathbb{Z}[\omega]$.

Remark: More generally, $Z[\omega] = \mathcal{O}_{Q[\omega]}$ for *every* cyclotomic field.

Notation: We write $\operatorname{disc}(\alpha) = \operatorname{disc}(1, \alpha, \dots, \alpha^{n-1})$.

Lemma 1.29

For $m \in \mathbb{N}$ we have $\operatorname{disc}(\omega) \mid m^{\varphi(m)}$.

Lecture 5, 10.11.2023

Lemma 1.30

For $m \geq 3$ we have $\operatorname{disc}(1 - \omega) = \operatorname{disc}(\omega)$.

Lemma 1.31

Let $m = p^r$ be a prime power, $r \in \mathbb{N}$. Then

$$\prod_{\substack{1 \le k \le m \\ \gcd(k,m)=1}} \left(1 - \omega^k\right) = p.$$

Remark: In particular for $m = p^r$ we have $\frac{p}{(1-\omega)^{\varphi(m)}} \in \mathbb{Z}[\omega]$.

2 Prime ideal factorisation

Motivation: If K is a number field with ring of integers \mathcal{O}_K , then we may not have a unique factorisation in \mathcal{O}_K into irreducible elements (up to units and ordering).

Example: Let $K = \mathbb{Q}(\sqrt{-5})$, then $\mathcal{O}_K = \mathbb{Z}[\sqrt{-5}]$. In $\mathbb{Z}[\sqrt{-5}]$ we have $2 \cdot 3 = 6 = (1 + \sqrt{-5})(1 - \sqrt{-5})$, where 2 and 3 are irreducible elements.

Our next goal is to replace factorisation into irreducible elements by prime *ideal* factorisation. Instead of number fields, we consider more generally *Dedekind domains*.

Definition (Integrally closed ring)

Let R be an integral domain and $K = \left\{ \frac{a}{b} \middle| a, b \in R, b \neq 0 \right\}$ its field on fractions. We call R integrally closed, if every element $\frac{a}{b} \in K$, which is a zero of a monic polynomial with coefficients in R is contained in R.

Example: Let K be a number field with ring of integers \mathcal{O}_K . Then \mathcal{O}_K is integrally closed. Indeed let $\alpha \in K$ satisfy $\alpha^n + b_1\alpha^{n-1} + \cdots + b_n = 0$, with $b_1, \ldots, b_n \in \mathcal{O}_K$. Then $\mathbb{Z}[\alpha, b_1, \ldots, b_n]$ is finitely generated as an additive group and we have $\alpha \in \mathcal{O}_K$.

Definition (Noetherian ring)

We call a commutative ring R noetherian if every ideal is finitely generated.

Remark: The following statements about a commutative ring R are equivalent:

- 1. R is noetherian.
- 2. Every increasing sequence of ideals is eventually constant, i.e. if $I_1 \subseteq I_2 \subseteq ...$, then there is some $n_0 \in \mathbb{N}$, such that $I_n = I_{n_0}$ for every $n > n_0$.
- 3. Every non-empty set S of ideals has a maximal element, i.e. there is some $M \in S$, such that if $M' \in S$ with $M \subseteq M'$, then M = M'.

Example: Principal ideal domains and polynomial rings $\mathbb{Z}[x_1, \ldots, x_n]$ or $K[x_1, \ldots, x_n]$ for any field K are noetherian.

Definition (Dedekind domain)

A *Dedekind domain* is a noetherian integrally closed domain, in which every non-zero prime ideal is maximal.

Theorem 2.1

Let K be a number field. Then its ring of integers \mathcal{O}_K is a Dedekind domain.

Example: Coordinate rings of irreducible smooth curves over an algebraically closed field, e.g. $\mathbb{C}[T]$ is a Dedekind domain.

First properties of Dedekind domains

Lemma 2.2

Let R be a Dedekind domain, which is not a field and $0 \neq I \subseteq R$ an ideal. Then I contains a product of non-zero prime ideals $P_1 \cdot \cdot \cdot \cdot \cdot P_k \subseteq I$.

Lemma 2.3

Let R be a Dedekind domain with field of fractions K and $0 \neq I \subsetneq R$ a ideal. Then there exists $\alpha \in K \setminus R$ with $\alpha I \subseteq R$.
